71 printer error codes. A: I would suggest that you call your former host, make sure they are still your contact and perhaps provide a way for them to send you the fix. There is a chance they are willing to get you back in business. A free system is going to be more prone to a virus, but it's more resilient to all of the other things that a full blown commercial system will have. Viruses are annoying, but are rare. They can't eat your business. Regular backups, regardless of how you do them, are unlikely to cause a mess of your business. Q: Migrating to ArcGIS Pro 2.3 - what format/method should I use for data in TAB I have a data file that I want to upload to ArcGIS Pro 2.3. I can export to a shapefile, but the data is currently in a table format and I want to make sure it's compatible. Any recommendations on how to export/import the data? Assuming that you are talking about a tab delimited text file: Create a new ArcGIS project. In ArcMap use Data Management to create a new dataset. In this new dataset you want to create an ASCII grid dataset. Click the Insert toolbox and choose Text to Table. This will create a new table and allow you to specify the delimiter, field name and other options. Then save the table. In ArcGIS Pro go to File > New...> Project and create a new project. In ArcGIS Pro go to Data > Import and select the newly created table. It should show up as a shapefile, you can then add the data to your project. You could also read in the data using the Import feature from File > Import, but I believe you want to do that so that you can use an intermediate shapefile when you make updates to the original dataset. Why is it incorrect to call the optional methods by self? I was trying to get the value from the textField like this: if let field = self.textField.text { return field.lowercased() } I found that textField.text is Optional. Why it is not possible to call the optional methods by self? 82157476af
